Events by Paige Ligris

A CRM and event-planning platform, built end to end

Louis Chartier | Full Stack Developer | Jan 2026 – Present

Executive summary

The project

A CRM and event-planning platform for a live business.

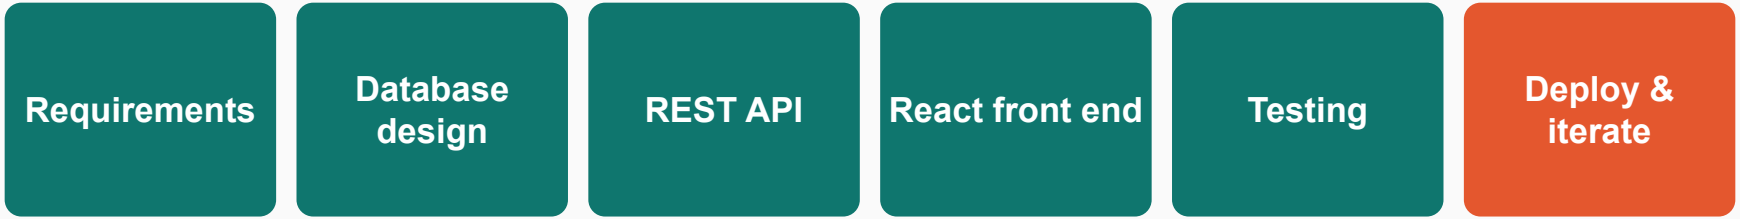

My role

Sole developer: requirements, database design, API, front end, deployment and iteration.

The result

In production on Railway with a custom domain, giving the owner live views of the business.

I owned the project from first conversation to production

- Started with the owner's requirements and turned them into a data model
- Made architecture decisions independently
- Walked the owner through each release and iterated on feedback

A normalized 15-table PostgreSQL schema models the whole business

Events | **Clients** | **Vendors** | **Inventory**

- Schema designed around four core areas: events, clients, vendors and inventory
- 15 tables in total, normalized to keep the data consistent
- Data integrity verified directly in pgAdmin

A secured Spring Boot REST API sits on top of the schema

API layer

Spring Boot REST API built on the PostgreSQL schema. Endpoints validated in Postman.

Security

JWT authentication
Spring Security
Role-based access control
BCrypt password hashing

The React front end delivers full CRUD across six modules

- Create, read, update and delete in every module
- Search and filtering to find records quickly
- CSV export with PapaParse
- PDF export with jsPDF

6

modules with full CRUD

A live dashboard and CRM layer give the owner a view of the business

Recharts dashboard

Live views of:
Revenue trends
Task priority
Lead pipeline

CRM layer

Client and vendor history tracking
Business analytics

Testing, release walkthroughs and AI-assisted speed kept delivery reliable

- Endpoints validated in Postman
- Data integrity verified in pgAdmin
- Walked the owner through each release
- Used Cursor AI to ship faster, with architecture decisions kept in-house
- Deployed to Railway with a custom domain

Technology stack

Layer	Tools
Frontend	React, Recharts, jsPDF, PapaParse
Backend	Spring Boot, REST API, JWT, Spring Security, BCrypt
Database	PostgreSQL (15 tables), pgAdmin
Testing & tooling	Postman, Git, GitHub, IntelliJ IDEA, VS Code, Cursor AI
Deployment	Railway, custom domain
